BUILD YOUR AI CEO — THE COMPLETE SETUP GUIDE

# Your Workspace — What It Is and Where It Lives

Build Your AI CEO: The Complete Setup Guide

MODULE 1 — DOWNLOAD PACKET

---

## What Is the Workspace?

Your workspace is the folder where all of your AI's files live — its identity files, memory, and operating documents. Every time OpenClaw starts up, it reads from this folder to load your AI's knowledge and context.

---

## Where Does the Workspace Live?

The workspace path is set during the **OpenClaw setup wizard in Module Four** — not before. You do not need to create this folder manually now.

**Default pathway (recommended for beginners):**

```
~/.openclaw/workspace
```

When the wizard prompts you for a workspace location, you will just press Enter to accept this default — but we will walk you through it step by step when you get there in Module Four.

**Custom location option:**

If you prefer a different location, you can type something like:

```
/Users/YourName/workspace
```

However, we recommend just using the default. It's the simplest option and works perfectly.

---

## What to Do Right Now

Do NOT create a Documents/workspace folder manually before Module Four.

For now, simply create a folder somewhere easy on your computer — your Desktop is perfect — and save all your MD files there as a temporary holding spot. Then in Module Four, once OpenClaw is installed and your workspace path is confirmed, we'll move everything into the right place together.

---

## Opening Your Workspace Quickly (Module Four and Beyond)

Once OpenClaw is installed and configured, you can open your workspace folder directly without hunting through Finder or File Explorer.

**Mac users — run this command in Terminal:**

▷ TERMINAL COMMAND — COPY & PASTE INTO TERMINAL

```
open "$(openclaw config get agents.defaults.workspace)"
```

This retrieves your configured workspace path and opens it directly in Finder.

**Windows users (WSL2 — recommended setup):**

▷ TERMINAL COMMAND — COPY & PASTE INTO TERMINAL

```
explorer.exe "$(openclaw config get agents.defaults.workspace)"
```

This opens your configured workspace in Windows File Explorer, even though the files live inside the Linux environment.

These commands work any time after OpenClaw is installed and the workspace path is configured. Bookmark them — they'll save you time every session.
