

BUILD YOUR AI CEO — THE COMPLETE SETUP GUIDE

Your AI Agent Tools Expansion Guide

Build Your AI CEO: The Complete Setup Guide

MODULE 5 — DOWNLOAD PACKET

Unlock Autonomous Operation

Your AI CEO is running. But right now, it's operating with a limited set of tools. The more you connect it to, the more independently it can operate — handling research, publishing, deployment, communication, and financial monitoring without you in the loop.

This guide covers the core integrations that transform your AI from a capable assistant into a fully autonomous business system. For each one: what it is, why it matters, and what your AI can do once it's connected.

The Tools

Memory (MEMORY.md)

What it is:

Your MEMORY.md file is your AI CEO's long-term brain. It stores everything your AI needs to know about you and your business across sessions — your preferences, goals, active projects, decisions made, and context built over time.

Why it matters:

Without memory, your AI starts every conversation from zero. With it, your AI knows your business the way a trusted chief of staff would — without you repeating yourself.

What you can do with it:

- Your AI remembers your ventures, your pricing, your clients, your workflows
- Context carries across sessions — no re-briefing required
- Your AI makes better decisions because it understands your long-term goals
- You can add entries like "never send emails without approval" or "our target client is X" and your AI will follow them permanently

How to use it: Keep your MEMORY.md updated. After any major decision, project launch, or preference change — add it. The more current it is, the more powerful your AI becomes.

OpenRouter

What it is:

OpenRouter is a service that gives your AI access to dozens of different AI models through a single API connection — including Claude, GPT-4o, Gemini, Llama, Mistral, and many more.

Why it matters:

Different tasks call for different models. Some models are better at reasoning. Some are faster and cheaper for simple tasks. Some excel at code. OpenRouter lets your AI route to the right model for each job automatically — and it can save you significant money by using lighter models when high performance isn't needed.

What you can do with it:

- Use Claude for deep reasoning and long documents
- Use lighter models for quick summaries or simple rewrites
- Access new models as they launch without changing your setup
- Reduce AI costs by routing to the most efficient model per task

Getting started: Create an account at openrouter.ai, add an API key, and connect it to your OpenClaw configuration.

GitHub

What it is:

GitHub is the world's most widely used platform for storing, managing, and versioning code and files.

Why it matters:

As your AI CEO builds things — websites, automations, templates, tools — that work needs to be stored, organized, and version-controlled. GitHub is where that happens. It's also the bridge that connects your AI's code to live deployment.

What your AI can do with it:

- Create and manage code repositories
 - Push code changes and commit updates
 - Maintain a full history of every file it builds
 - Trigger automatic deployments through integrations like Vercel
 - Review and manage pull requests
 - Store all your business documentation and config files securely
-

▲ Vercel

What it is:

Vercel is a deployment platform that takes code from GitHub and makes it live on the internet — instantly and automatically.

Why it matters:

Without Vercel, publishing a website or web app requires manual steps, server configuration, and technical overhead. With it, the entire process is automated. Your AI pushes a change to GitHub, and Vercel publishes it to a live URL within seconds.

What your AI can do with it:

- Deploy websites and web applications automatically on every code push
 - Manage multiple projects and domains from one place
 - Roll back to a previous version instantly if something breaks
 - Configure custom domains and HTTPS with no manual setup
 - Host landing pages, course platforms, sales funnels, and web tools
-

 Tavily**What it is:**

Tavily is an AI-native web search and research tool built specifically for use by AI agents — not humans typing into a search bar.

Why it matters:

Standard web search returns noisy, unstructured results designed for human eyes. Tavily returns clean, structured data that your AI can reason over, synthesize, and act on. It's the difference between throwing a pile of raw ingredients at a chef and handing them a prepped mise en place.

What your AI can do with it:

- Research competitors, markets, and pricing in real time
 - Find and qualify leads from public business data
 - Scan news and industry developments on a schedule
 - Pull factual information to support decisions and reports
 - Monitor what's being said about your brand or industry
 - Gather data for reports, proposals, and content briefs
-

 Gamma**What it is:**

Gamma is an AI-powered platform for creating professional presentations, pitch decks, and documents.

Why it matters:

Visual, polished documents close deals. Gamma lets your AI produce them quickly — no design skills required, no manual formatting. What would take a human hours gets done in minutes.

What your AI can do with it:

- Build pitch decks and client proposals automatically
 - Generate course materials, guides, and PDF resources
 - Create polished sales presentations from a brief or bullet points
 - Produce branded documents that match your visual identity
 - Export to PDF, shareable link, or slide format
-

 Stripe**What it is:**

Stripe is the leading payment processing and financial infrastructure platform used by businesses of all sizes.

Why it matters:

Your AI CEO can be your financial analyst — but only if it can see your financial data. Connected to Stripe, your AI has real-time visibility into your revenue, customers, and transactions.

What your AI can do with it:

- Pull revenue reports and MRR on demand
 - Check subscription status and customer payment history
 - Create payment links for new offers or products
 - Monitor for failed payments or churn signals
 - Flag unusual transaction activity
 - Generate financial summaries for decision-making
-

 Email**What it is:**

Direct integration with your email inbox and outbox — allowing your AI to read, send, and manage email on your behalf.

Why it matters:

Email is where business lives. Most entrepreneurs spend 2–4 hours a day managing their inbox. A connected AI handles the routine 80% of that — so you only see what actually requires your judgment.

What your AI can do with it:

- Send outbound emails and follow-ups on your behalf
- Read and summarize your inbox — surface what matters
- Draft replies for your review before sending
- Follow up on unanswered threads automatically
- Flag urgent or high-priority messages
- Manage outreach sequences and drip campaigns
- Send client reports, invoices, and updates automatically

Note: Always configure email with a clear approval policy in your `MEMORY.md` — for example: "Draft all emails for review before sending unless explicitly told to send." This keeps you in control of outbound communication.

✂ X (formerly Twitter)

What it is:

Direct integration with your X account — allowing your AI to operate your social presence autonomously.

Why it matters:

Consistency is the biggest challenge in social media. Most people post when they feel like it — which means they post inconsistently. A connected AI posts on a schedule, finds conversations to engage with, and builds your presence daily whether you're paying attention or not.

What your AI can do with it:

- Post content to your feed on a schedule
- Find relevant conversations in your niche and reply to them
- Respond to mentions and comments
- Identify trending topics to weigh in on
- Follow and engage with target accounts
- Monitor what's being said about your brand or competitors
- Build an engaged audience through consistent, strategic presence

Sentry

What it is:

Sentry is an error monitoring and application performance platform that watches your deployed applications in real time.

Why it matters:

When your AI is deploying code — which it will be once GitHub and Vercel are connected — bugs happen. Sentry catches them before they become problems, and it catches them automatically so you don't have to.

What your AI can do with it:

- Monitor live applications for errors, crashes, and performance issues
 - Receive instant alerts when something breaks
 - Diagnose the root cause of errors automatically
 - Trigger fixes without requiring human intervention
 - Maintain a log of all issues and resolutions
 - Keep your client-facing products running cleanly without manual oversight
-

What's Coming Next: The AI Agent Wallet

Here's something that changes everything — and it's being built right now.

Your AI CEO can do an enormous amount. But there's one thing it still can't do on its own: **spend money**. It can't buy a domain, pay for a software subscription, or purchase a dataset. Every time a payment is required, a human has to step in. That's the last major bottleneck between your AI and full autonomy.

Several of the largest companies in the world are actively removing it.

Company	What They're Building
Mastercard	<i>Agent Pay for Machines</i> — a payment system designed specifically for autonomous software, supporting cards, accounts, and stablecoins
Coinbase	<i>Agentic Wallets</i> — programmable wallets that give AI agents a financial identity, spending limits, and the ability to execute transactions
MetaMask	<i>Agent Wallet</i> — a self-custodial wallet with built-in security checks and user-defined limits for AI-driven DeFi and commerce
Circle	Programmable USDC wallets for AI-driven micropayments and autonomous transactions

The model is straightforward: you define the rules — spending limits, approved categories, transaction thresholds — and your AI operates within them. It can identify a tool it needs, pay for it, and integrate it. Without you doing anything except approving the parameters upfront.

We are approaching the moment where your AI CEO can manage a real business budget. That's not a future feature. That's infrastructure being shipped in 2026.

When it's fully here, the gap between you and a fully autonomous AI-powered business closes completely.

Your Integration Priority Order

If you're not sure where to start, here's the recommended sequence based on impact:

Priority	Integration	Why Start Here
1	Memory (MEMORY.md)	Already built — keep it current starting today
2	Email	Highest daily time savings; immediate ROI
3	GitHub + Vercel	Enables everything your AI builds to go live automatically
4	Tavily	Turns your AI into a real-time researcher
5	Stripe	Gives your AI financial visibility
6	X	Enables consistent social presence without daily effort
7	OpenRouter	Cost optimization and model flexibility
8	Gamma	Accelerates client deliverables and proposals
9	Sentry	Critical once you have live applications running

Each integration compounds the ones before it. A connected AI with memory, email, research, deployment, and financial visibility isn't just helpful — it's operational.
